### Abstract:

In principle, more than one **routers** are intervened between different IP subnets. RFC1577 "Classical IP and **ARP** over ATM", which is specified to provide IP service over ATM network, also requires that the **router** be used between different LISs (Local IP Subnet). However, the intervention of the **router** is not always an effective solution for inter-LIS communication over ATM network. If there is a direct virtual channel connection between two endpoints in the same ATM network, they can exchange their information directly without the help of a router. Actually, some groups of IETF and ATM Forum are looking on such tasks. As the NHRP (Next Hop Resolution Protocol) or MPOA (Multi-Protocol Over ATM) are being drafted. However, since those protocols are too heavy and complicated, it is not easy to implement. In this paper, we propose a simple efficient solution for inter-LIS communication. Our solution is exactly compatible with RFC1577. We describe how RFC1577 can be used to provide inter-LIS communications and introduce our prototype systems and test-bed network.

### Index Terms:

asynchronous transfer mode local area networks protocols ATM IP subnets RFC1577 classical IP direct virtual channel connection inter-LIS communication logical IP subnet protocol over ATM next hop resolution protocol prototype systems test-bed network
